## DL103 graphite body MK.IV cartridge

The modification that CLINAMENAUDIO carries out on the DL103 is a mechanical improvement. All the electrical specifications remain the same.

The only positive function the case performs is protection of the internal components! Other than that, its effect is detrimental to the sound. The volume of air trapped within the case acts as an acoustic chamber: the air is excited by the movement of the stylus causing internal resonance which adds distortion to the audio signal generated from the moving coil of the cartridge.

We remove the plastic cover & replace it with a CNC high density isostatic graphite shell which converts any resonance into heat, dissipating them in an acoustically harmless way. The sound of the cartridge is totally transformed by this modification!

We are also working on an ebony version.
